

## TECHNICON GANTRY – EXTENDS THE COBOT’S OPERATIONAL RADIUS

---

Technicon Gantry extends the robot’s working range by extending the x-axis/horizontal. Technicon Gantry is supplied in special dimensions and with an integrated UR Cap, enabling the user to increase the robot’s operating radius.

This means that Technicon Gantry can be used in a larger production area, improves the options for flexible automation and rapid production scaling.

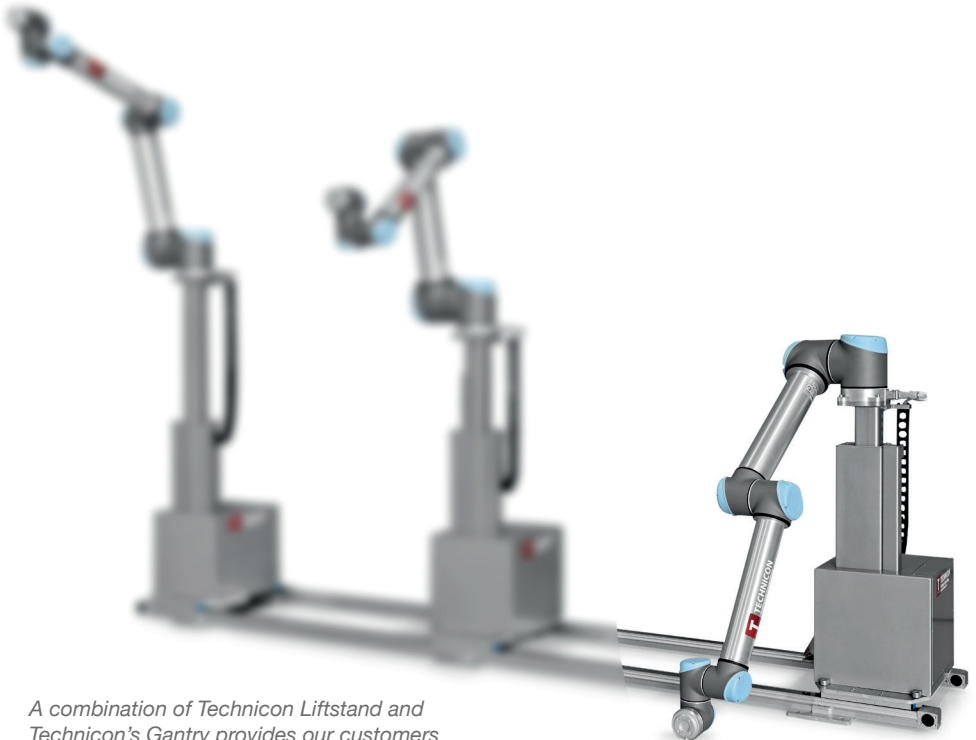

Using Technicon Gantry, cobots can now move between several workstations. This increases flexibility and reduces costs in several ways. Using Technicon Gantry will save you costs on one or several robots. At the same time, output is strengthened because productivity is increased through more efficient manning of production equipment and less frequent changeover.

Technicon Gantry is thus an inexpensive and efficient way to gain productivity benefits, simply because the individual cobot’s mobility, potential and return on investment is significantly improved.

# SPECIFICATIONS

*Technicon Gantry is sold as a 3 m version. It can also be supplied with special dimensions, as an extended version with several meters.*

*The integrated user-friendly UR Cap ensures easy control.*

*A combination of Technicon Liftstand and Technicon's Gantry provides our customers with an extended operating range.*
